birlasoft **Cyber UW**

Turn applications into faster quotes that win the book.

Catch & mitigate risk blind spots early.

See how it works

Talk to us

Gain competitive speed advantage to win more deals

~30–60 min less hunting per file*

Caught early

Claims vs reality

EDR and MFA stories checked before quote.

Defensible

Own the decision

Why you quoted.
What you overrode.
What went to PAS.

Less swivel

Sort the pack

From inbox noise to fields you can actually work.

Rules on

Apply appetite

Quote, refer, or decline with reasons you can change.

*Illustrative. Mid specialty desks often make the spend case when research drops by about half an hour to an hour a file and weak control claims get caught early. Not Birlasoft production stats. Marsh GIMI Q2 2026: global cyber rates down 4%, twelfth straight quarterly drop.

THE PRODUCT

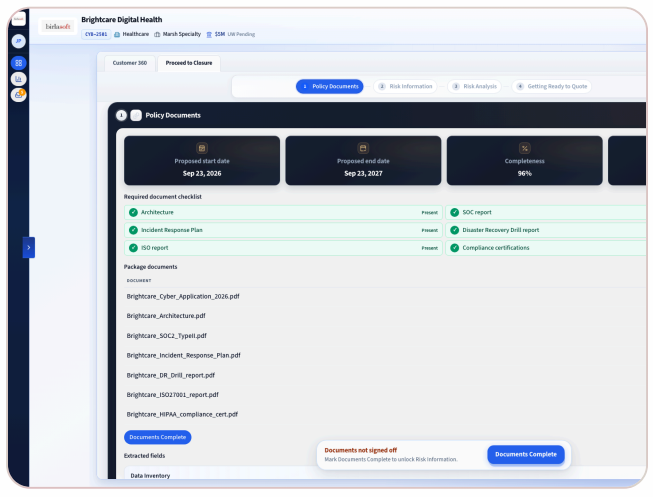

Advanced integrated risk modeling & personalised rule-driven triaging compatible with 3rd party apps

One file. Three moves. Not a chat window wearing underwriting clothes.

01

Get the pack in

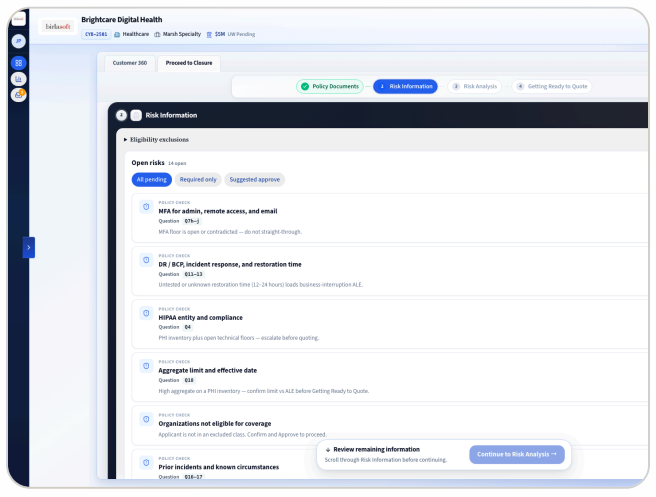

Email lands. Docs get typed. What's missing shows up before someone retypes the whole application by hand.

02

Check what they claimed

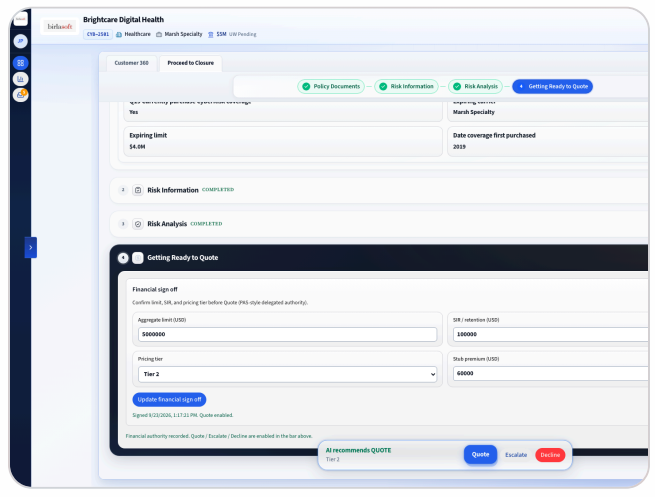

They said MFA and backups. The scan says otherwise. You see the conflict, with the source, before anyone prices it.

03

Make the call, then hand it off

Appetite on. Limit and SIR locked. Quote, refer, or decline. Then push the decision into your policy system with a trail you can defend.

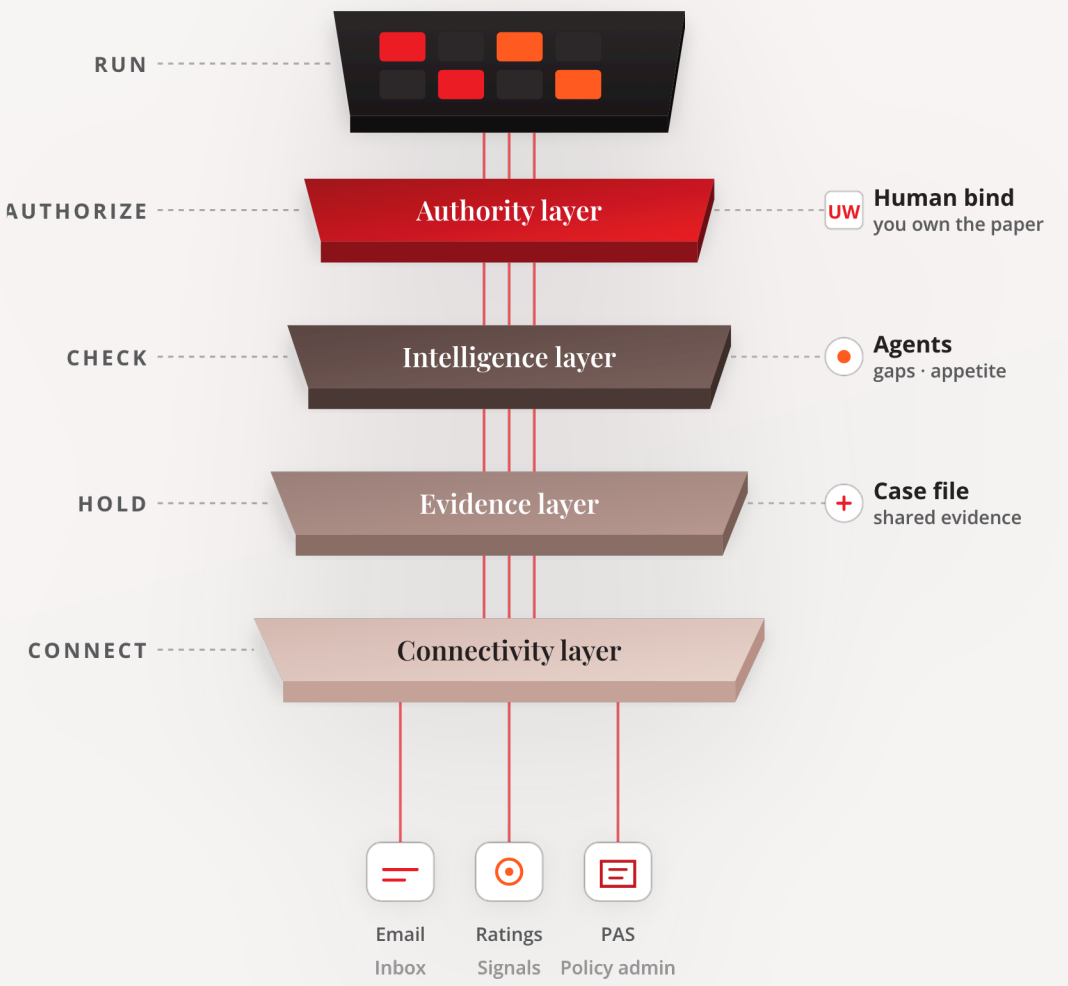

HOW IT FITS

How Cyber UW integrates with your policy system

Soft-market speed **forces a new desk architecture** — one that stages intake, gaps, appetite, and bind as **a single system**. Ratings and cat models stay partners. Your underwriters still own the paper.

- **You still bind**
  Quote, refer, decline, and every outbound stay with the underwriter.
- **Gaps with a source**
  What they attested vs what the signal shows. No mystery score floating above a chat.
- **One decision file**
  Reasons, overrides, a light book alert, ready for policy admin.
- **Buy the feeds, don't rebuild them**
  Plug in BitSight-class ratings and cat engines. Day one is not "build CyberCube."

WHY BIRLASOFT

For desks that keep their own paper

You need Coalition-class turnaround. You do not need to become an insurer that also runs security products.

The spine buyers ask for

Conflict board. Appetite you can version. A written why. Chat polish is not the product.

Mid specialty, not SMB spray

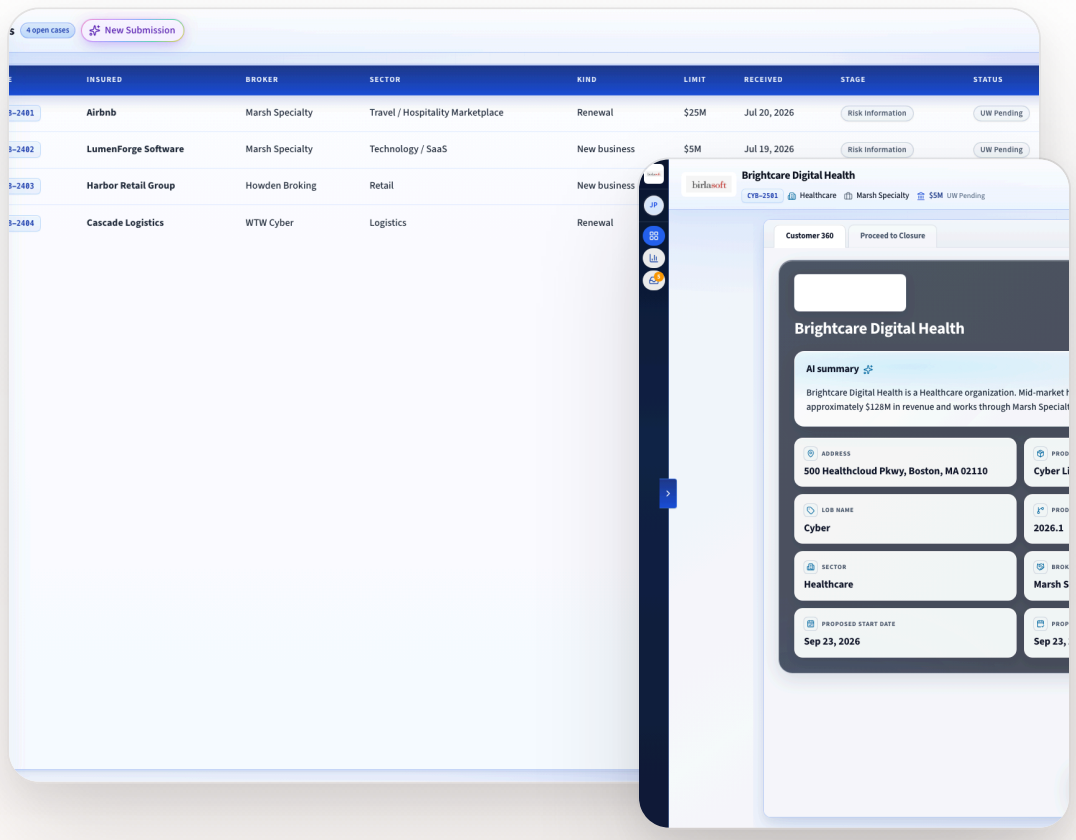

MGA and carrier cyber desks racing on speed while keeping their panel and their book.

Keep what already binds

We sit between broker email and PAS. Ratings stay partners. No rip-and-replace speech.

Audit built in, not bolted on

Override logs and cite-back from the start. Useful when someone asks for the evidence pack later.

FAQS

Ask us straight

Are you trying to be the next Coalition?

No. Coalition sells insurance and a security bundle. We sell a workbench for desks that keep writing their own paper: pull the pack, catch control gaps, apply appetite, hand off to PAS. Wiring in ratings and cat feeds is intentional. It is not "we gave up."

Do we have to throw out BitSight or our PAS?

No. The tools that stick become the place everything meets: ratings and catastrophe models come in, policy admin gets the decision out. We live between broker email and your core. We do not replace either.

Will it bind on its own or invent answers on the app?

No. That is how you lose trust and get into regulatory trouble. Humans still quote, refer, or decline. What came from the applicant vs what came from a scan stays clear on the file, even when the broker is yelling for a same-day quote.

Who is this actually for?

Specialty mid-market MGA and carrier cyber desks that need speed without rebuilding an InsurSec stack. Complex or OT files where one submission eats hours. EU and UK books where evidence packs are not optional. Bad fit: SMB straight-through that Cowbell-class writers already own.

How is this different from a form chatbot?

A chatbot pulls fields out of a PDF. That is the easy demo. A workbench stages the job: show the control gaps, apply appetite with an override log, leave a decision file you can defend. In a soft market, selection discipline is the score. Shiny questionnaire extraction is not.

See a real pack go from inbox to bind-ready.

We'll walk a cyber submission with you. Gaps, appetite, handoff. No slide theater.
