

# Competitor research — cyber underwriting Decision Workbench

Birlasoft · 2026-07-20 · Secondary only · Companion: `USER-RESEARCH.md`

## A. Market value signals

| Signal             | What buyers reward                                                                             | Birlasoft implication                                                 |
|--------------------|------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------|
| Soft-market speed  | Quote faster without silent control concessions                                                | Decision dossier + early gap requests for information, not more forms |
| Attest vs posture  | Scan-backed underwriting is table stakes (Coalition / At-Bay / Cowbell)                        | Gap board is the credibility wedge                                    |
| Stack trichotomy   | External signal + catastrophe model + managing general agent telemetry — desks run two or more | Integrate BitSight / CyberCube-class tools; do not rebuild them       |
| Shared-vendor risk | Dependent business interruption / concentration (Aon)                                          | Accumulation <i>alert</i> at quote time                               |
| Agentic baseline   | Triage at intake, not chat-that-waits                                                          | Orchestrated stages + human-in-the-loop bind                          |

**Proof-of-concept sell:** faster disciplined selection. **Do not sell:** “next Coalition.”

## B. Agentic architecture (ahead of curve)

**Ahead in 2026** = specialist agents + decision orchestrator + human-in-the-loop cite-back — not a single large language model on a form (WNS, DeNexus, AIG / Lexington-style narratives).

| Horizon          | State                                                    | Our target                                                       |
|------------------|----------------------------------------------------------|------------------------------------------------------------------|
| Horizon 1        | Copilot on a form                                        | Easy demo; easy dismiss                                          |
| <b>Horizon 2</b> | Orchestrated agents + human-in-the-loop                  | <b>Proof of concept should look like this</b> (mocks acceptable) |
| Horizon 3        | Continuous posture + claims / incident-response learning | Later roadmap / partners                                         |

**Spine:** intake → gap / signal → appetite → tier → book alert → human-in-the-loop decide → dossier / audit → policy administration system.

**Now:** stage roles, explainability, underwriter override, mock ports, swappable appetite.

**Later:** continuous monitoring, catastrophe portfolio brain, incident-response learning loop, automatic appetite-rule proposals.

**Claim:** decision orchestrator + cyber control-gap spine clients personalize — not chat-only, not an insurance-plus-security carrier stack.

## C. Feature benchmarking

| Class                                          | Examples                   | Stance                              |
|------------------------------------------------|----------------------------|-------------------------------------|
| Insurance-plus-security managing general agent | Coalition, At-Bay, Cowbell | Do not compete — wrong go-to-market |

|                                               |                                         |                                                 |
|-----------------------------------------------|-----------------------------------------|-------------------------------------------------|
| Ratings / attack-surface management           | BitSight, SecurityScorecard, Black Kite | Partner (mock in proof of concept)              |
| Catastrophe / portfolio                       | CyberCube, Cyence                       | Partner later; stub now                         |
| Underwriting workflow artificial intelligence | Cytora-class                            | Overlap on intake; differentiate on cyber spine |

|                | Capability                                                                                                                                                             |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Win</b>     | Gap board, early request for information, appetite + Quote / Refer / Decline reasons, dossier / audit, accumulation stub, policy administration sync, white-label path |
| <b>Parity</b>  | Intake, completeness, shared record                                                                                                                                    |
| <b>Partner</b> | External signals, continuous monitoring, systemic loss                                                                                                                 |
| <b>Out</b>     | Direct-insured telemetry, security-services bundle                                                                                                                     |

**Positioning:** enable managing general agent / carrier desks versus insurance-plus-security managing general agents; consume signals; alert concentration; own **gap + appetite + book watch + policy administration**.

*Checklist cells = synthesis, not audited certifications. Primary win/loss interviews still to be done.*
